

SPATHIPHYLLUM (Peace Lily)

The Spathiphyllum more commonly known as “Peace Lily” is one of our favorite choices here in the Flower Shop. It is one of the few green houseplants that will provide the enjoyment of blooms. Spathiphyllum tolerates lower light conditions, and will provide lush green foliage with a minimal number of blooms, given brighter light conditions it will flourish and the number of blooms will be greater.

- **WATER-** Provide ample water. The Spathiphyllum will wilt quickly without adequate moisture. It requires less water in the winter than in the spring and summer.
- **LIGHT-** Prefers bright filtered light, but will survive in low interior light.
- **TEMP-** Average temperatures 68°-85° are ideal, avoid temperatures below 55° F.
- **FERTILIZER-** Once a month with a balanced fertilizer such as 20-20-20 works well.
- **TIP-** periodically use a damp cloth to remove dust from leaves as this helps prevent pests from getting started on your plant.
