

Zamioculcas zamifolia (ZZ Plant)

Talk about a tough plant that can be used indoors! This plant has recently arrived to the horticultural industry, and is all that it's proclaimed to be and more. Those who have tried the ZZ plant in low light situations have been impressed with the fact that it didn't just sit there, but started to grow. Not spindly growth, but good strong stalks and leaves. An added bonus is that it requires minimal watering and is not prone to pest problems. If you have a difficult indoor situation where other plants have failed, why not try a ZZ plant? Seldom do we run across a plant like this!

- WATER- Drench thoroughly and allow it to dry out between watering.
- LIGHT- Will do well in a wide variety of light situations, prefers filtered or diffused sunlight, but; will tolerate lower light conditions.
- TEMP- Comfortable in average household temperatures 62-85 degrees.
- FERTILIZER- Use a balanced fertilizer every 4-6 weeks.
